

Hunting for γ -rays from Fast Radio Burst (FRBs) using *Swift*/BAT & GUANO

By: Maxwell A. Fine

Advised by: Dr. Ziggy Pleunis, Dr. Paul
Scholz,
Prof. Bryan Gaensler

Fast Radio Bursts (FRBs):

- Transient radio emission of unknown extragalactic origin, there are more than 600 CHIME/FRBs
- Timescale of burst in radio wavelengths is ~1ms to 1s
- Most FRB progenitor models involve magnetars, and predict associated γ -ray emission
- So far, FRBs have only been observed at radio wavelengths

2022, *Astron. Astrophys. Rev.*, 30, 2

Project Motivation:

- Previous γ -ray searches looked at a single repeating FRB, and established fluence limits of $\sim 10^{-7}$ erg/cm²
- Thanks to GAUNO, there is corresponding *Swift*/BAT data for more than 500 CHIME/FRBs
- No one has yet searched these CHIME/FRBs with *Swift*/BAT data
- Project: systematic survey to look for γ -ray emission from more than 500 CHIME/FRBs

Swift/BAT Prospects

Goals & Timeline:

Mid October

- Decide on search parameters
 - Timescales in γ -rays ✓
 - Energy Bands ✓
 - Model Spectrums ✓

January-February In Progress

- Develop analysis pipeline to look for γ -ray counterparts to CHIME/FRB events

March

- Run pipeline on all CHIME/FRB events with GUANO data
 - Determine fluence limits on γ -ray counterparts

Corresponding *Swift*/BAT Data

In Progress

Analysis of Light Curves
of CHIME/FRB Targets

Analysis of Images of CHIME/FRB
Targets

Pipeline

Light Curve Analysis:

- *Swift*/BAT light curves are more sensitive than corresponding images. If there is a corresponding γ -ray event we should see it
- Searches light curve in signal to noise (SNR) space for a peak using a boxcar search with different sized boxcars for different time scales
- Boxcar search is looking around a window ± 3 s centered on the CHIME/FRB detection time in the light curve

Light Curve
Swift ID 00031385006

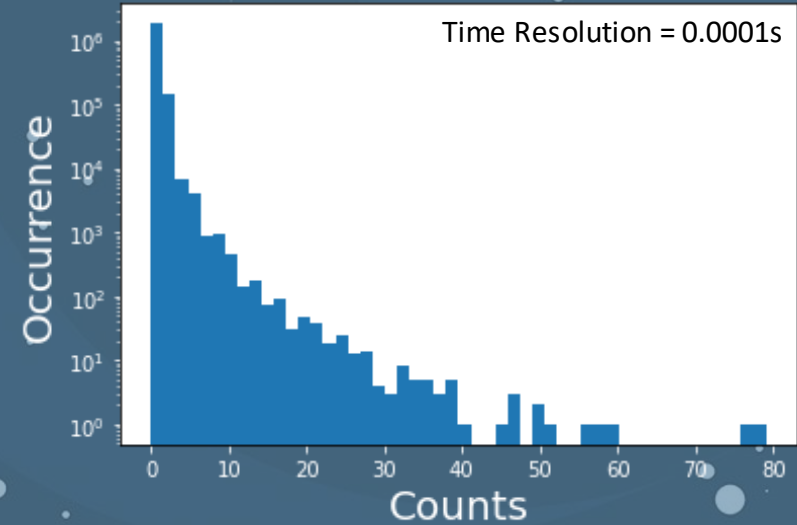

Time Scale vs Peak SNR

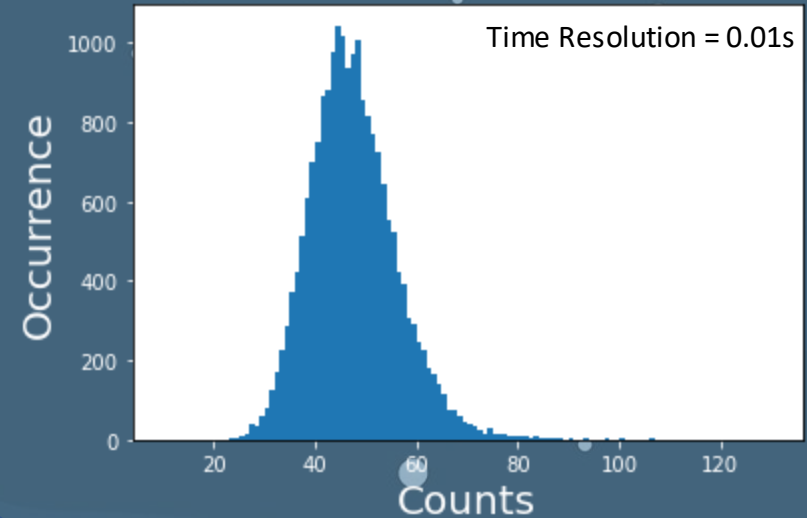

Issues:

- SNR Is way off for our test! **WHY!**
- Lead to an investigation of the statistical properties of the light curves
- Mean and STD are too **low**, when using the instrumental resolution of 0.0001s (1e-4s)
- Photon Counts do not follow a Gaussian distribution when light curve time resolution is small $\leq 0.001s$ (1e-3s)

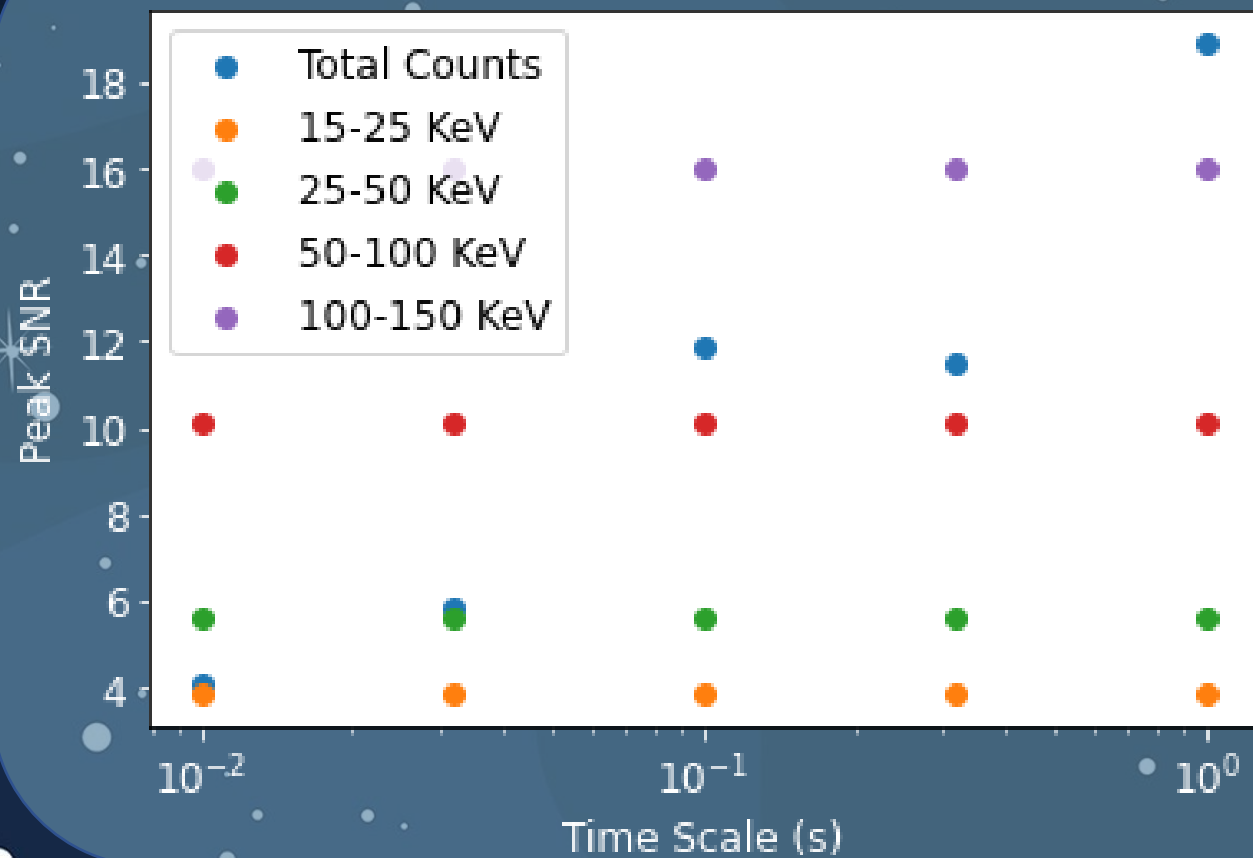

Photon Counts Per Time Bin

Photon Counts Per Time Bin

Time Scale vs Peak SNR

Outlook & Next Steps:

December:

- Further test the light curve analysis code with simulations or real GRBs
- Start the *Swift*/BAT sky image analysis code

January & Early February:

- Finish the *Swift*/BAT sky image analysis code
- Test sky image code
- Run pipeline
